-- vyber prvých n prvkov zo zoznamu
take      :: Int -> [a] -> [a]
take 0 _  = []
take _ [] = []
take n (x:xs) = x : take (n-1) xs
```

```
-- dĺžka zoznamu
```

```
length      :: [a] -> Int
length []   = 0
length (x:xs) = 1 + length xs
```

Hypotéza (pre ľubovoľné n a xs):

- $\text{length (take } n \text{ xs)} = n$
- $\text{length } \$ \text{ take } n \text{ xs} = n$
- $(\text{length} . \text{take } n) \text{ xs} = n$

Dôkaz - $\text{length (take } n \text{ xs)} = n$

Indukcia (vzhľadom na dĺžku xs):

- $\text{xs} = []$

$\text{length (take } n \text{ [])} = 0$

$0 = 0$

č.b.t.d.

$\text{length (y:take } (n-1) \text{ ys)} = n$

$1 + \text{length (take } (n-1) \text{ ys)} = n$

indukčný predpoklad, $|\text{ys}| < |\text{xs}|$

QuickCheck a funkcie

Funkcie sú hodnoty ako každé iné
Ako vie QuickCheck pracovať s funkciami ?

- je skladanie funkcií komutatívne ?

```
"?: " import Text.Show.Functions
```

```
"?: " quickCheck(
```

```
  (\x -> \f -> \g -> (f.g) x == (g.f) x)::Int->(Int->Int)->(Int->Int)->Bool)
```

```
*** Failed! Falsifiable (after 2 tests):
```

- je skladanie funkcií asociatívne ?

```
"?: " quickCheck(
```

```
  (\x -> \f -> \g -> \h -> (f.(g.h)) x == ((f.g).h) x)  
  ::Int->(Int->Int)->(Int->Int)->(Int->Int)->Bool)
```

```
+++ OK, passed 100 tests.
```

Opäť to NIE je DÔKAZ, len 100 pokusov.

QuickCheck a predikáty

Predikát je len funkcia s výsledným typom Bool

- `filter p1 (filter p2 xs) = filter (p1 && p2) xs` ☹️

```
?: " quickCheck ( \xs -> \p1 -> \p2 ->
    filter p1 (filter p2 xs) == filter (p1 && p2) xs)

```

<interactive>:113:91:

Couldn't match expected type 'Bool' --- NEPLATÍ LEBO ANI TYPY NESEDIA

- `filter p1 (filter p2 xs) = filter (\x-> p1 x && p2 x) xs` 😊

+++ OK, passed 100 tests.

Opäť to NIE je DÔKAZ (ten už bol), len 100 pokusov.

- `(filter p1 xs) ++ (filter p2 xs) = filter (\x -> p1 x || p2 x) xs`

```
"?: " quickCheck ( \xs -> \p1 -> \p2 ->
    (filter p1 xs) ++ (filter p2 xs) == filter (\x -> p1 x || p2 x) xs)
    :: [Int] -> (Int->Bool) -> (Int->Bool) -> Bool)

lebo skladanie fcií je asociatívne:

- $((f . g) . h) x = (f . g) (h x) = f (g (h x)) = f ((g . h) x) = (f . (g . h)) x$
- funkcie nevieme porovnávať, napr. $\text{head } [(+1), (+2), (*3)] = \text{id}$
- funkcie vieme permutovať, $\text{length } \$ \text{permutations } [(+1), (+2), (*3), (^2)]$

Zákon fúzie – pre foldr

Fussion Law:

Nech g_1, g_2 sú binárne funkcie, z_1, z_2 konštanty

Ak pre funkciu f platí :

$$f \ z_1 = z_2 \ \&\& \ f \ (g_1 \ a \ b) = g_2 \ a \ (f \ b)$$

potom platí

$$f \ . \ foldr \ g_1 \ z_1 \ xs = foldr \ g_2 \ z_2 \ xs$$

Príklad použitia Fussion Law:

$$(n^*). \underbrace{foldr \ (+) \ 0}_{sum} = foldr \ ((+) \cdot (n^*)) \ 0$$

Dôkaz (pomocou Fussion Law): overíme predpoklady

čo je čo ?!:

$$f = (n^*), \ z_1 = z_2 = 0, \ g_1 = (+), \ g_2 = (+) \cdot (n^*)$$

- $L.S. = (n^*) \ (a+b) = (n^*a + n^*b) = (+) \cdot (n^*) \ a \ ((n^*) \ b) = P.S.$ ☒

$\underbrace{\hspace{10em}}_{t \rightarrow u}$

Intuícia: Keď máme vytvoriť zoznam pomocou funkcie g zo zoznamových konštruktorov $(:) []$, na ktorý následne pustíme foldr , ktorý nahradí $(:)$ za f a $[]$ za z , namiesto toho môžeme konštruovať priamo výsledný zoznam pomocou $g \text{ } f \text{ } z$.

Otypujme si to (aspoň):

Ak $z :: u$, potom $f :: x \rightarrow u \rightarrow u$, $\text{foldr } f \text{ } z :: [x] \rightarrow u$.

Ľavá strana: $([x] \rightarrow u).(t \rightarrow [x])$ výsledkom je typ $t \rightarrow u$

Pravá strana: $g :: (x \rightarrow u \rightarrow u) \rightarrow u \rightarrow (t \rightarrow u)$

foldr a foldl pre pokročilejších

definujte foldl pomocou foldr, alebo naopak:

$\text{myfoldl } f \ z \ xs = \text{foldr } (\backslash x \rightarrow \backslash y \rightarrow (f \ y \ x)) \ z \ (\text{myReverse } xs)$

hmmm..., teoreticky (možno) zaujímavé, prakticky nepoužiteľné ...

foldr a foldl posledný krát

Zamyslime sa, ako z foldr urobíme foldl:

induktívne predpokladajme, že rekurzívne volanie foldr nám vráti výsledok, t.j. hodnotu y , ktorá zodpovedá foldl:

- $y = \text{myfoldl } f \ [b,c] = \lambda z \rightarrow f (f z b) c$

nech x je ďalší prvok zoznamu, t.j.

- $x = a$

ako musí vyzerat' funkcia $?$, ktorou fold-r-ujeme, aby sme dostali $\text{myfoldl } f \ [a,b,c] = \lambda z' \rightarrow f (f (f z' a) b) c = ? \ x \ y$

- $? = (\lambda x \ y \ z' \rightarrow y (f z' x))$

dosad'me:

- $(\lambda z' \rightarrow (\lambda z \rightarrow f (f z b) c) (f z' a)) =$
- $(\lambda z' \rightarrow f (f (f z' a) b) c) =$
- $\lambda z' \rightarrow f (f (f z' a) b) c$

Pre tých, čo neveria, fakt posledný krát
